Cut-off criteria:

All major raw materials and all the essential energy is included. The production processes for raw materials and energy flows with very small amounts (less than 1%) are not included. These cut-off criteria do not apply for hazardous materials and substances.

Allocation:

The allocation is made in accordance with the provisions of EN 15804. Incoming energy and water and waste production in-house is allocated equally among all products through mass allocation. The recycling process and transportation of the material is allocated to this analysis.

Data quality:

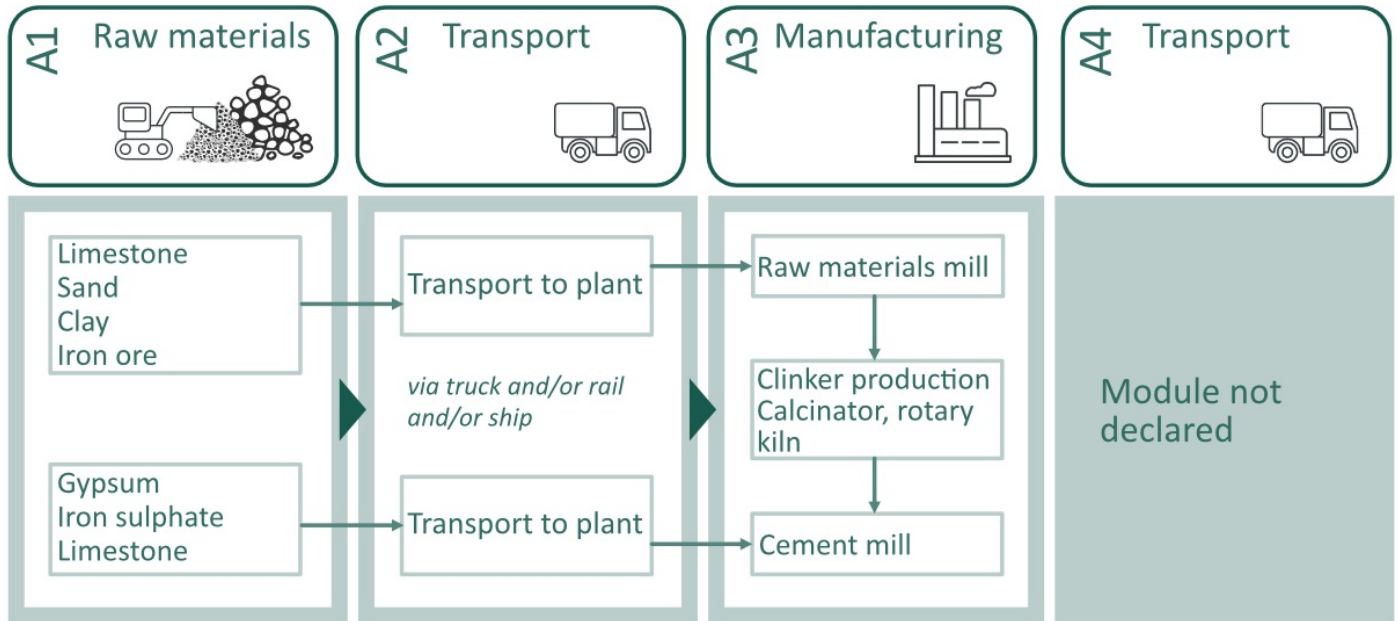

Specific data for the product composition are provided by the manufacturer. The data represent the production of the declared product and were collected for EPD development in the year of study. Background data is based on EPDs according to EN 15804 and different LCA databases. The data quality of the raw materials in A1 is presented in the table below.

Remarks to environmental impacts

The parameter GWP (A1-A3) includes 28 kgCO₂-eq per t cement deriving from fossil and 25 kgCO₂-eq per t cement from non-fossil components when combusting secondary (alternative) fuels for the production of cement clinker. In accordance with the "polluter pays" principle / EN 15804 /, the emissions will be added to the production system that caused the waste. However, in this EPD, the CO₂ contribution from components of secondary (alternative) fuels has not been deducted.

This is to be able to compare calculated global warming from cement regardless of the status of the waste in different countries.

GWPIOBC		kg CO ₂ -eq	7,17E+02

GWPI-IOBC: Global warming potential calculated according to the principle of instantaneous oxidation. In order to increase the transparency of biogenic carbon contribution to climate impact, the indicator GWP-IOBC is required as it declares climate impacts calculated according to the principle of instantaneous oxidation. GWP-IOBC is also referred to as GWP-GHG in context to Swedish public procurement legislation.
